

SOURCE — PostgreSQL (sales_raw schema)

EXTRACTION — Postgres to S3 (assumed ours to build — Open Item #2)

S3 raw/ — untouched mirror, no repair/transform

SNOWFLAKE — External Stage (Storage Integration, no embedded keys)

BRONZE — COPY INTO, structural mapping only, no business logic

SILVER — Python UDF repair, flatten, MERGE/dedup (Section 4.1)

GOLD — dimensions, funnel fact, KPI views (Section 3 + 6)

EXPORT — COPY INTO flat files (matches PDF stage paths exactly)

REPORTING — confirmed by SME, two options proposed

OPEN ITEMS (dashed orange boxes):

- #1 Schema sales_raw vs raw — strong evidence, not SME-confirmed
- #2 leads_raw scope — assumed out of scope, documented rationale
- #3 Extraction mechanism — assumed ours to build
- #4 WRAPPED_ACTIVITIES — genuinely open, undiscoverable from data
- #5 DEA_INTERNAL flag — working assumption (dataengineeracademy.com)

RESOLVED: #6 Reporting tool (green boxes, bottom-right) — Streamlit in Snowflake (A) + Tableau Desktop (B) proposed

#7 Outcome duplication — resolved via field-scoped mapping

MONITORING (blue dashed boxes, right column) — added per SME feedback: no failure/fallback pipeline was originally shown
